This historic book may have numerous typos and missing text. Purchasers can download a free scanned copy of the original book (without typos) from the publisher. Not indexed. Not illustrated. 1922 Excerpt: ...production a? well custom made cars. (Joseph N. Smith & Co., Detroit.) fitted between the glass frames and the standards. The shapes and sizes of these rubber fillers depend upon the shape of the shield. Sometimes they are attached to the glass frames and sometimes to the standard. (See Figs. 365 and 366.) With the advent of the swinging lower glass a weather strip was made necessary; two cross sections of typical weather strips for the lower glasses are shown in Figs. 367 and 368. Several methods have been devised to make a weather-tight joint between the upper and lower glass. The first system was to have the upper glass overlap the lower one, as shown in Fig. 369. This works fairly well, but does not keep the cold air or rain from blowing up between the glasses. In Fig. 370 is shown a section of the upper and lower glasses with a rubber filler inserted between them. This method is used very extensively, as it makes a good close joint between the glasses. There is one trouble, and that is to get the shields to have a uniform space between them as any distortion of the body reduces or increases this space, and when this gap is reduced it is liable to cause a fracture in the glasses. The system shown in Fig. 371 overcomes these objections, and the only factor that is to be watched is to see that the glasses are set square in the standards so that a close joint is made along the entire length of the rubber. On the top of the shield a rubber weather strip is sometimes fitted, and this will work very well when a level surface is provided on top for this strip to fit against. This condition is shown in the Fig. 372. The weather strip is attached to the frame in the same Fig. 372 n. A typical design of windshield wing. (Automotive Accessories, Inc.. Kokomo, ...
